

Redirecting

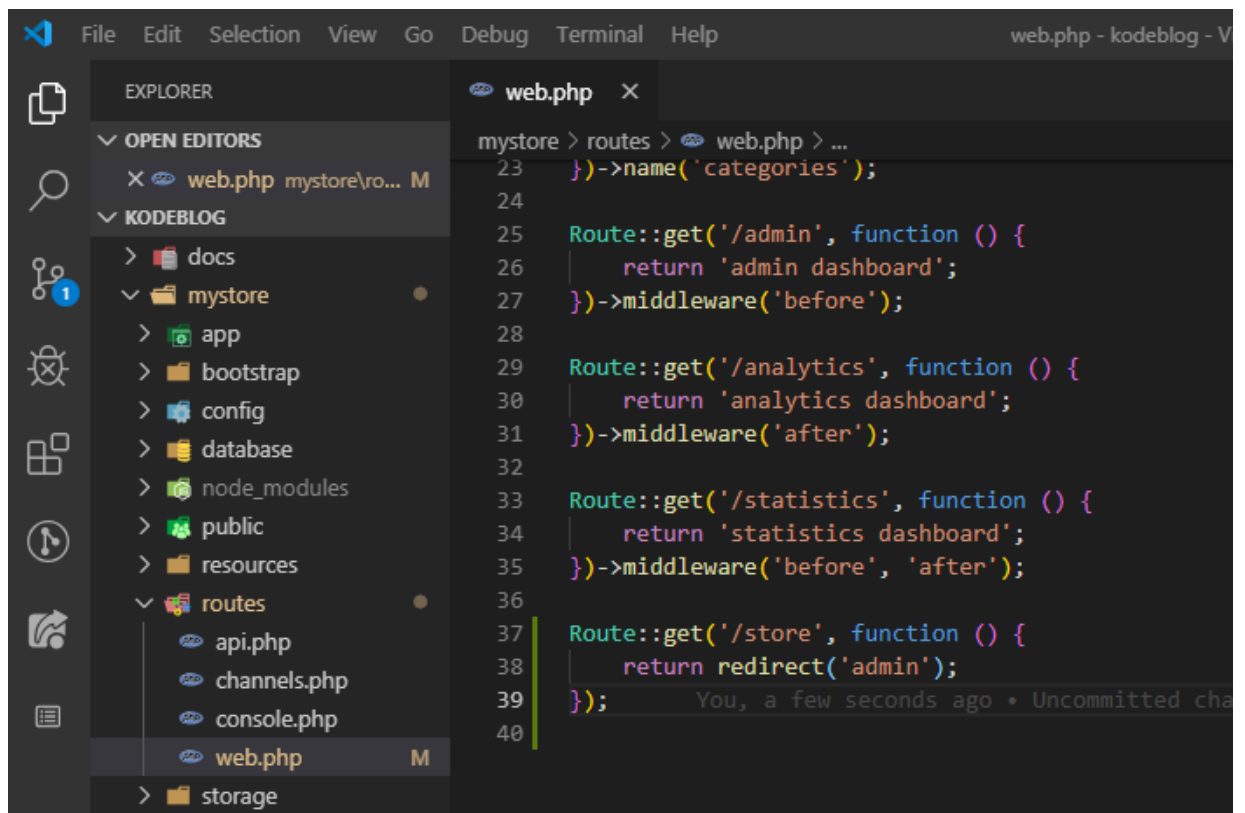

Description

- Redirecting is loading a different URL from with a route during execution time.
- For example, if you have a URL that stores a resource in the database, you will want to redirect to the view item page after creating the resource.

Example

Create a Redirecting Route

- In VSC, open file `kodeblog\mystore\routes\web.php`
- create a redirecting route

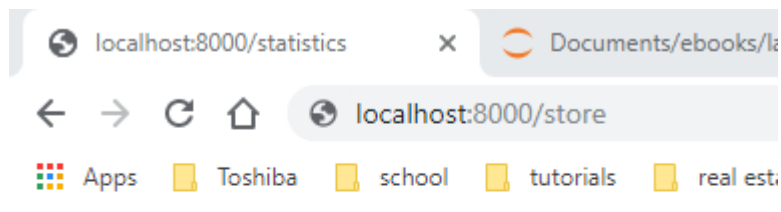

```
mystore > routes > web.php > ...
23     }->name('categories');
24
25     Route::get('/admin', function () {
26         return 'admin dashboard';
27     }->middleware('before');
28
29     Route::get('/analytics', function () {
30         return 'analytics dashboard';
31     }->middleware('after');
32
33     Route::get('/statistics', function () {
34         return 'statistics dashboard';
35     }->middleware('before', 'after');
36
37     Route::get('/store', function () {
38         return redirect('admin');
39     });
40
```

Testing

Try to Access store Route

`http://localhost:8000/store`

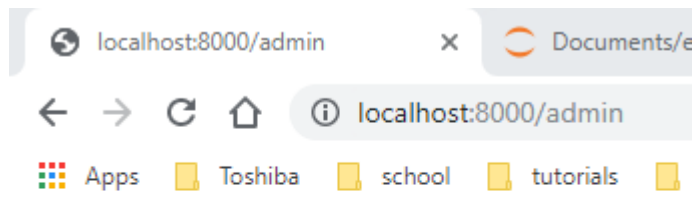

middleware before executing the route

middleware after executing the route

statistics dashboard

Redirected to admin Route

middleware before executing the route

admin dashboard
